

Use of beta-glucosidase activity for flavour enhancement in specialty beers

Luk Daenen
Chair De Clerck 2012

Flavour complexity

Flavour modification

Here, focus on **biological** approach (no flavour addition):

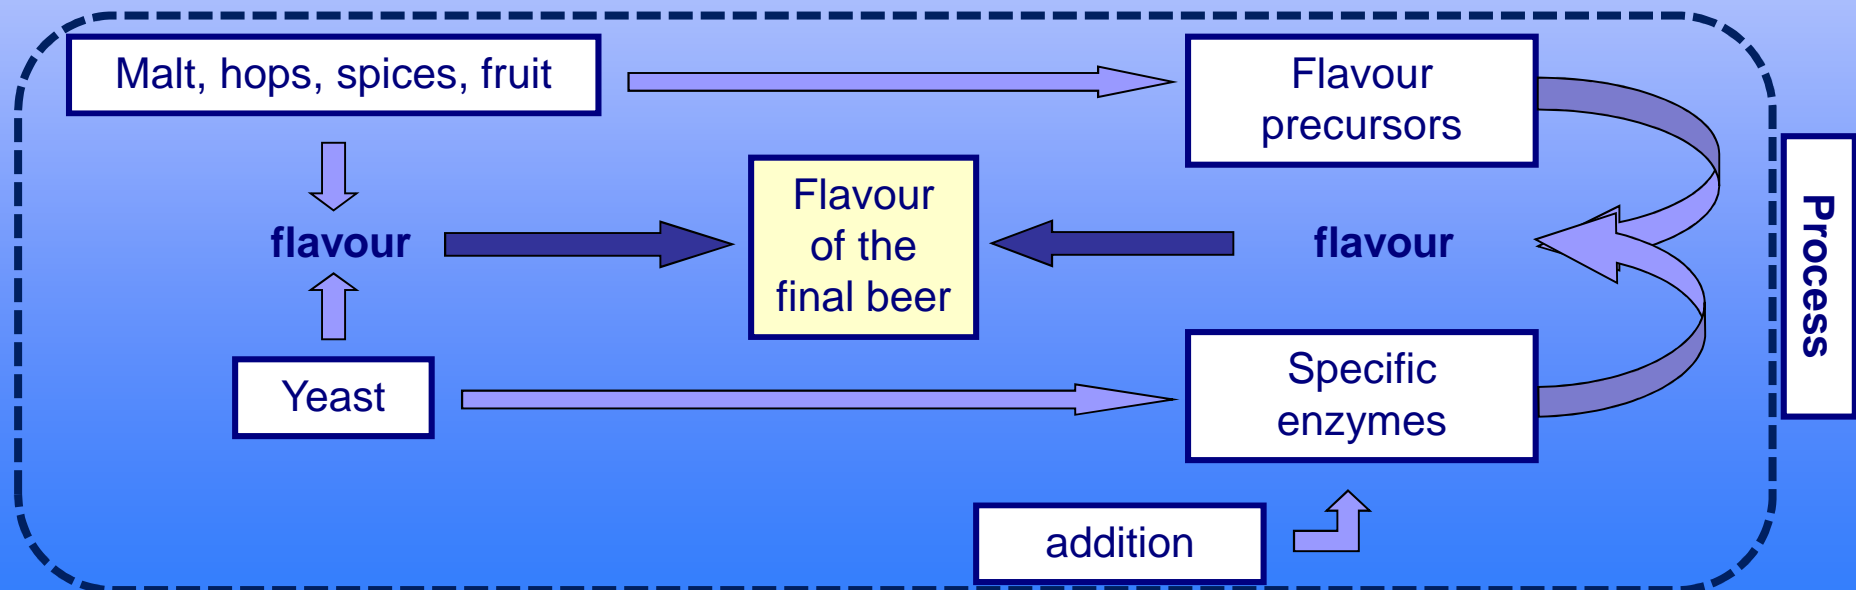

→ Use of plant parts/extracts, enzymes, microorganisms

■ Preferred by consumers:

■ Natural product, traditional process, authenticity, health, environment

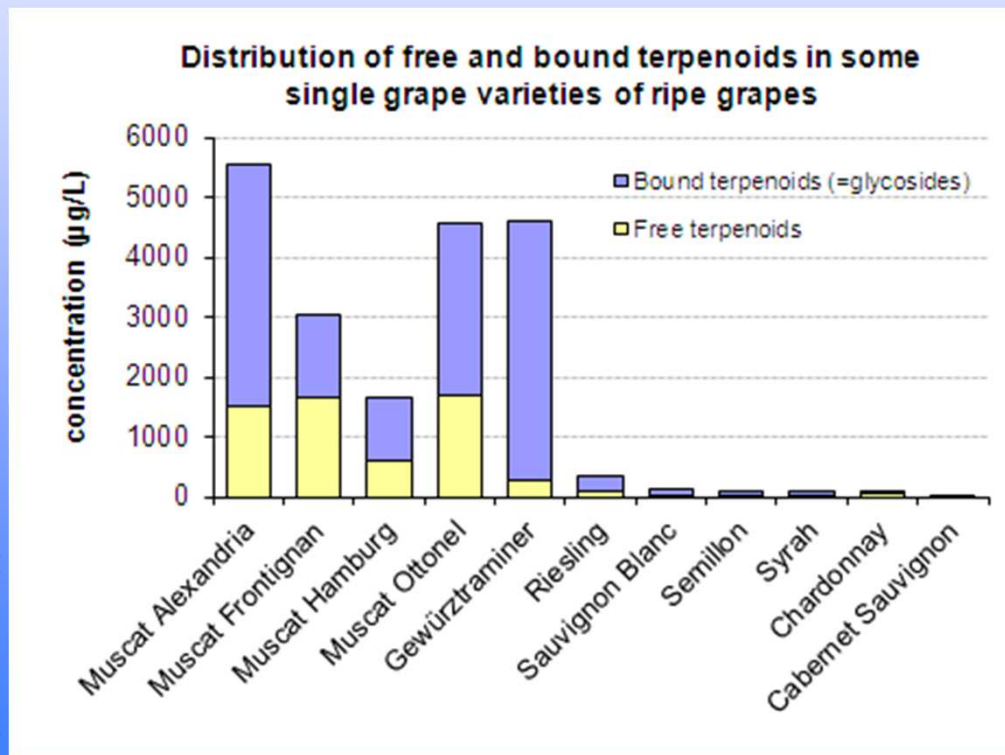

■ Advantage for producer:

■ “clean label”, often cheaper, development of complex and subtle flavours

Interest for wine-making

- Some grape varieties have a significant pool of glycosidically bound flavour compounds → **hidden flavour potential**
- Hydrolysis by yeast, enzymes,...

Gunata et al 1984

Interest for brewing industry

Hops

- Flavour precursors in “green” part of hops (flowers, leaves, ...)
- Enhance “hoppy” aroma by precursor hydrolysis
- Interest for **lager, ale, geuze, specialty beers, ...**

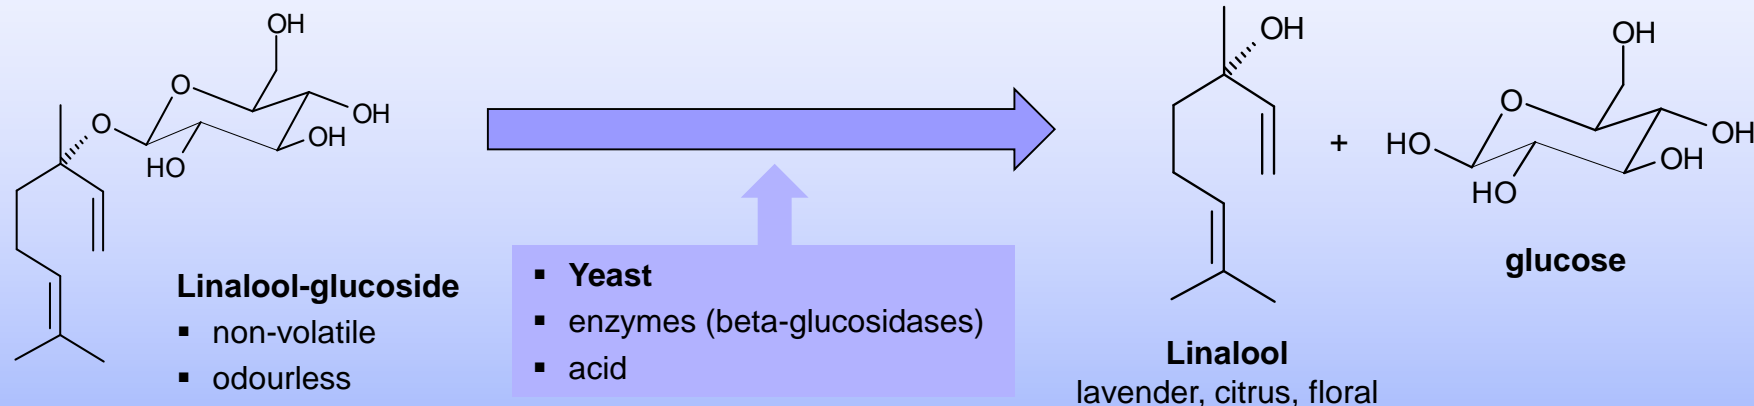

Cherry

- Flavour precursors in juice, kernel, skin
- Enhance cherry flavour by precursor hydrolysis
- Interest for **fruit beers**

Release of hidden flavour potential

Glycosidically bound flavour compounds = glycosides

Treatment		Comment
Acid hydrolysis	Low pH (3,0 -3,5)	Separate proces; Sour beers
Enzymatic hydrolysis	Eg. Enzymes from <i>Aspergillus niger</i>	Side activities possible: <ul style="list-style-type: none"> ▪ HCD activity → 4-VG ▪ Anthocyanidin breakdown (loss of colour) ▪ Esterase activity → isoamylacetate ↓
Yeast biotransformation	<i>Saccharomyces</i> sp.	Mostly low or moderate activity
	<i>Brettanomyces</i> sp.	High activity; but also other Brett flavours (!)

→ Different treatments lead to different flavour profiles

Selection of yeast strains

■ *Saccharomyces* sp.

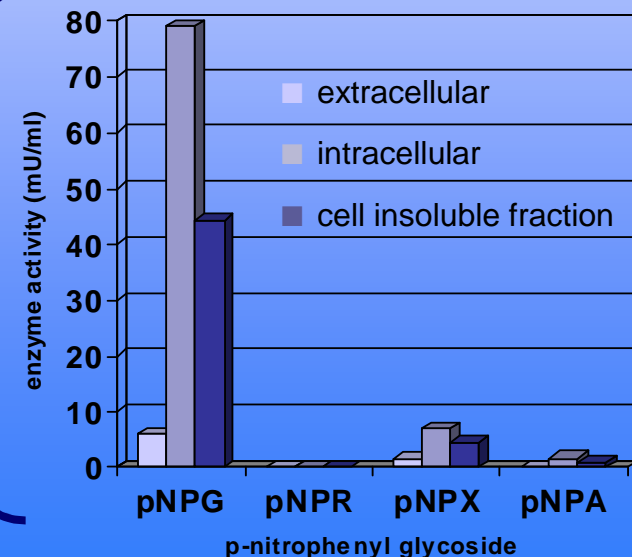

- Mostly no β -glucosidase
- All have **exo-1,3- β -glucanase activity** →
→ Low to moderate activity
- Some commercial wine strains with inducible β -glucosidase

■ *Brettanomyces* sp.

- Some with high β -glucosidase
- Mainly **cell associated**
(low extracellular)
- Also minor glycosidase activities

Isolation of hop glycosides

Hop pellets

(Saaz)

Supercritical CO₂ extraction

Essential oils
Soft resins

spent hops / hop residue / hop solids

- 1) ethanol / water
- 2) ethanol evaporation

extraction

watery extract

Solid Phase Extraction (XAD2)

- 1) wash with water
- 2) elution with ethanol
- 3) evaporation
- 4) PVPP → remove polyphenols

purification

hop glycoside extract

Aglycones from hop glycosides

YPD fermentation with added hop glycosides

Linalool:

- citrus, floral, aniseed
- important contributor to hop aroma

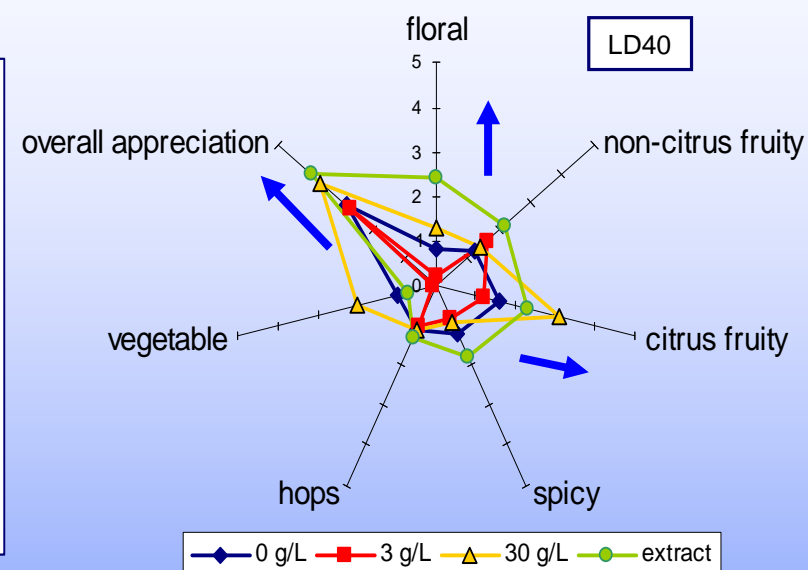

Methyl salicylate:

- wintergreen, minty, spicy

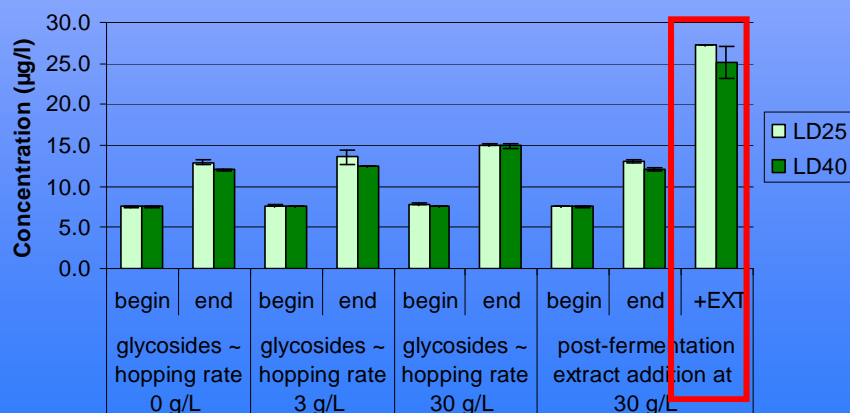

Wort fermentation with *S. cerevisiae* brewing strains

- Wort + Saaz hop glycosides, or post-fermentation addition of a pre-hydrolyzed extract
- Fermentation with *S. cerevisiae* LD25 and LD40 (low and high exo-1,3- β -glucanase)
- **Results:**
 - Linalool: significant \uparrow in extract; similar for 2 yeasts
 - Dihydroedulan & theaspiranes: clear \neq for 2 yeasts
 - Sensory: significant increase; other compounds seem to be involved

Linalool

Theaspirane B

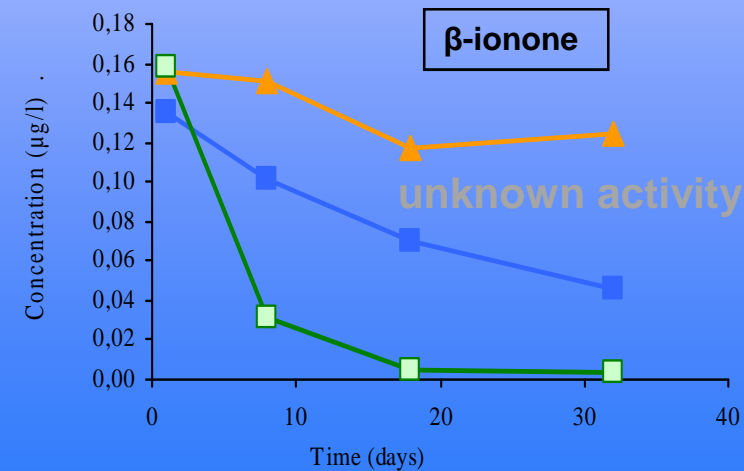

Refermentation of a dry-hopped beer by different yeasts

▲ *S. cerevisiae*

■ *S. cerevisiae* + *B. bruxellensis*

□ *S. cerevisiae* + *B. custersii*

'Kriek'-beer

■ Traditionally:

- ☐ intact sour cherries are added to wooden casks filled with young lambic
- ☐ leaving it for 5 to 6 months
- ☐ the sugar from the sour cherries triggers a second fermentation

■ Currently:

- ☐ also cherry pulp, cherry juice and cherry stones
- ☐ fruit extracts and essences
- ☐ flavours

Aglycones from sour cherry glycosides

SPME GC/MS

Control pH 5.0

Schmid and Grosch (1986): benzaldehyde, linalool and eugenol are some of the important contributors to cherry aroma

Cherry stones contain the cyanogenic glycoside amygdalin

Development of cherry flavour

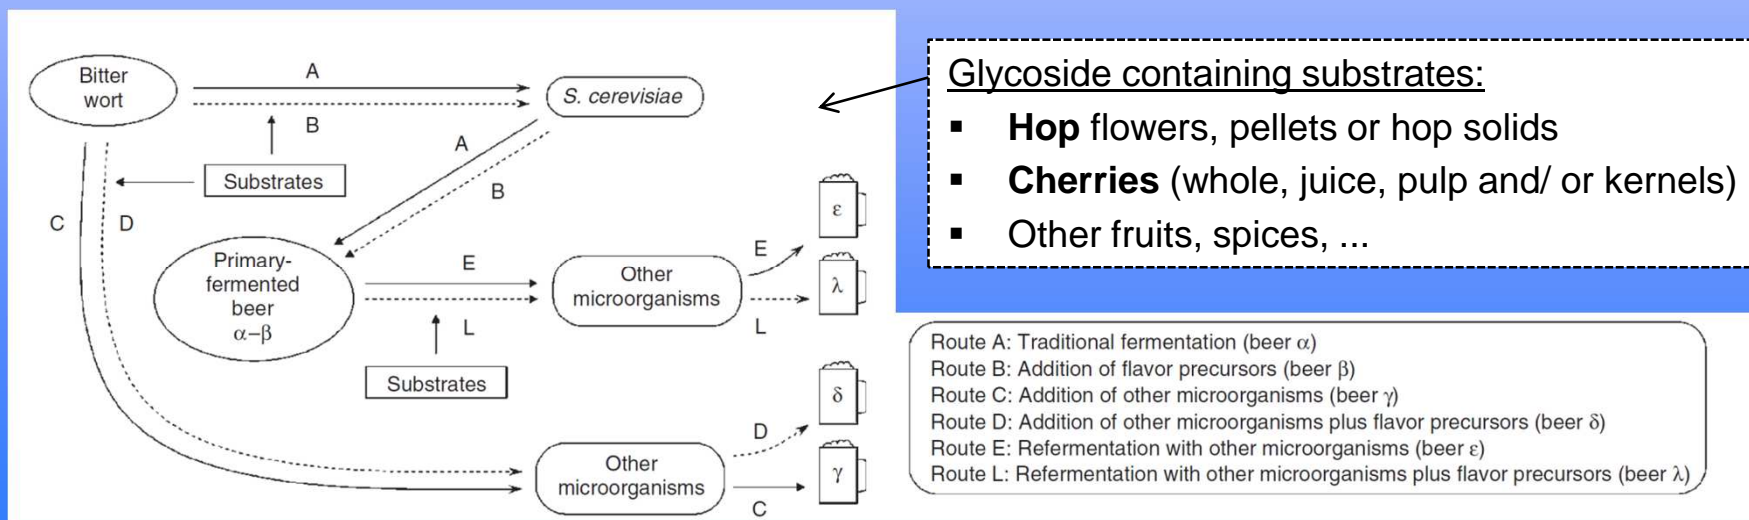

- Refermentation of a base beer, with addition of **200g sour cherries** per liter
- Yeast: *Brettanomyces custersii* strain, selected for its high beta-glucosidase activity
- **Results:**
 - Increase in benzyl compounds (especially benzaldehyde reduced to benzylalcohol)
 - also other compounds important for cherry flavour: geraniol, eugenol, linalool

Summary

Treatment		Comment
Acid hydrolysis	Low pH (3,0 -3,5)	Separate proces; sour beers
Enzymatic hydrolysis	Eg. Enzymes from <i>Aspergillus niger</i>	Some have side activities: HCD activity → 4-VG Anthocyanidin breakdown (risk of color loss) Esterase activity → isoamylacetate ↓
Yeast biotransformation	<i>Saccharomyces</i> sp.	Mostly low or moderate activity
	<i>Brettanomyces</i> sp.	High activity; but also other Brett flavours

→ Different treatments lead to different flavour profiles

Back-up slides

Hop glycoside flavour potential

concentrated hop glycoside
extract in buffered medium

- ◆ control at pH 5.0
- ◆ acid hydrolysis at pH 3.0
- ◆ enzyme hydrolysis (almond β -gluc.)
- ◆ enzyme hydrolysis (AR2000)

- Release of sensory active aglycones
- Possible impact on the overall beer flavor ?

Brettanomyces LD72 identification

- 1st identification → physiological tests
- 2nd → PCR fingerprinting (primers M13 and OPA09)

Table 8: Acid-tolerant yeasts in lambic fermentation (Verduyn and De Maessene 1998)

Months of fermentation of lambic

13-18 19-24

% of total

Brettanomyces species

Brettanomyces *Dekkera*

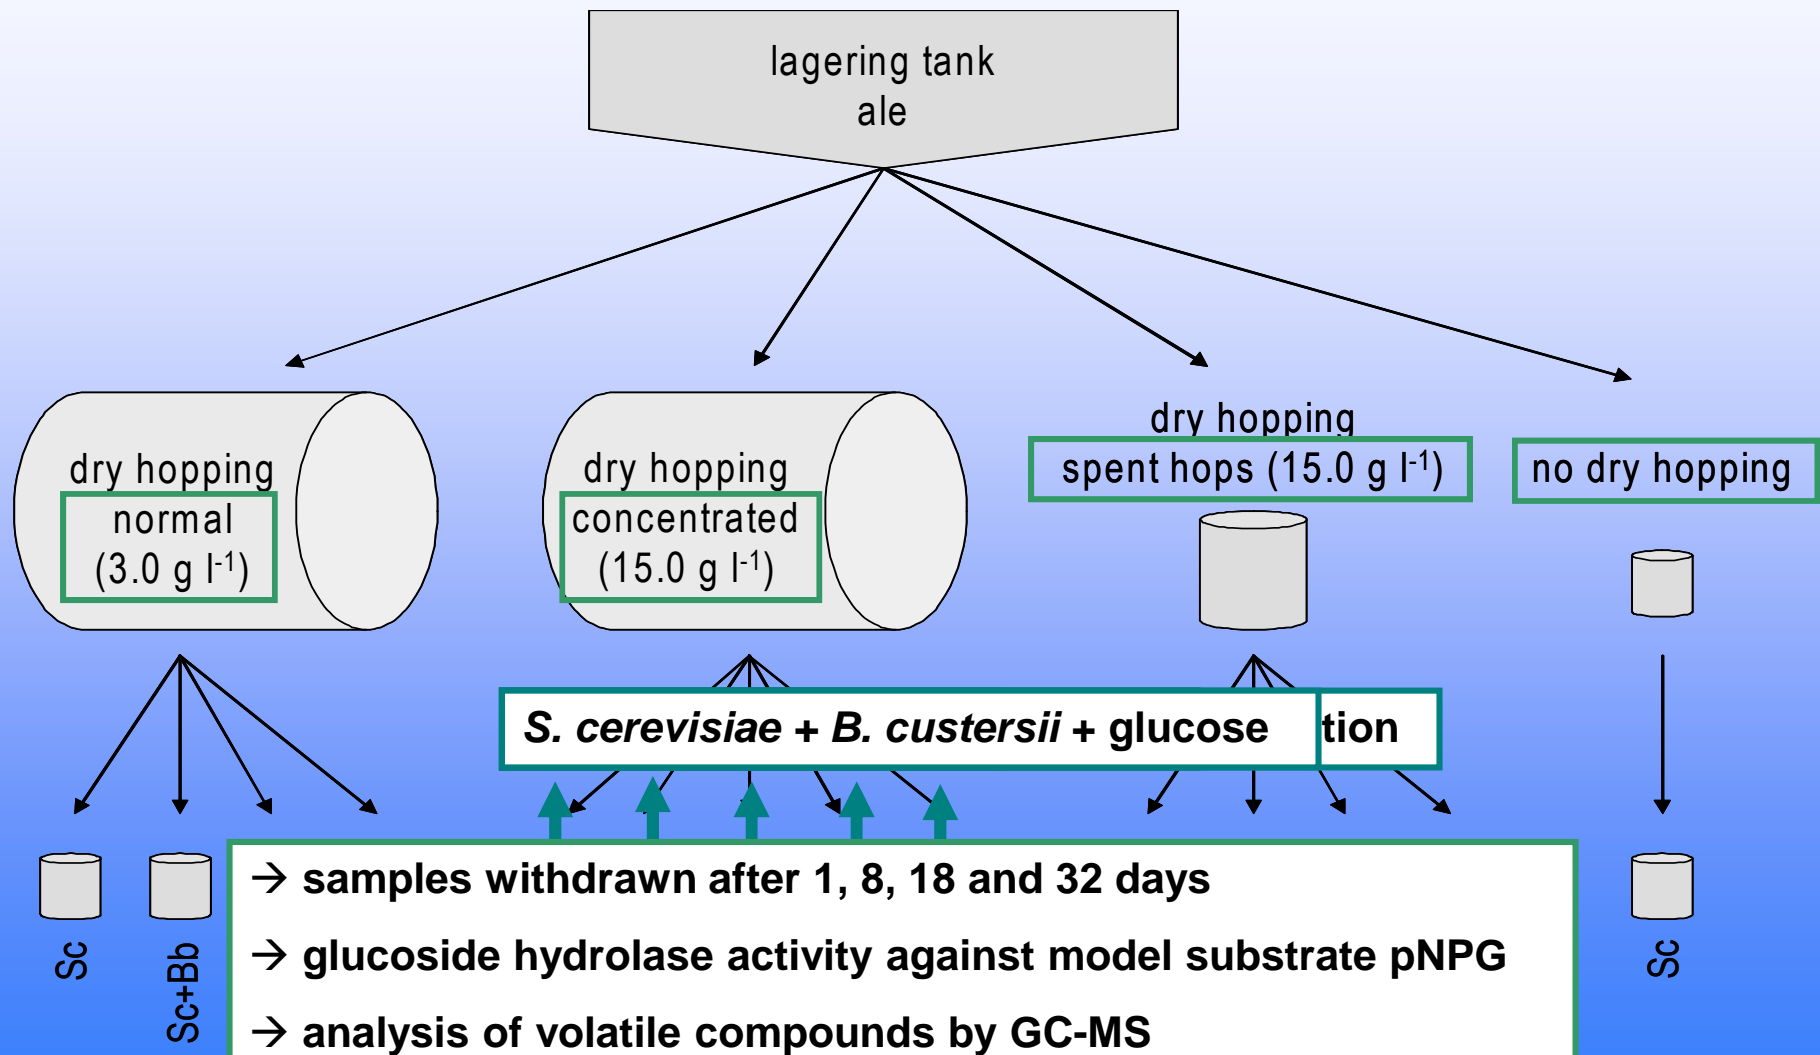

Brettanomyces^a

<i>abstinens</i>	0	0
<i>anomalus</i>	3	6
<i>bruxellensis</i>	0	0
<i>clausenianus</i>	1	0
<i>clausenii</i>	0	0

Experimental set-up of dry-hopping trial

HCN potential in sour cherry stones

Regulation of HCN in foodstuffs → EU-directive 88/388/EEC (1988)

1 mg HCN per (v/v)% alcohol

Example: cherry beer → 4 (v/v)% alcohol
→ maximum 4 mg HCN / litre

200 g cherries / litre beer

stones = 5-7% of total weight
(Chaovanalikit & Wrolstad 2004)

10 - 14 g stones / litre beer

amygdalin in stones: 0.22 (w/w)%
(Chandra *et al.* 1993)

22.0 – 30.8 mg amygdalin / litre beer

$MW_{\text{HCN}} = 27 \text{ g/mol}$ $MW_{\text{amyg}} = 457 \text{ g/mol}$

1.30 – 1.82 mg HCN / litre beer **< 4 mg HCN / litre !**

Released benzaldehyde:
5.1 – 7.1 mg / litre
threshold: 2 mg / litre

Considering:
- maximum release
- no evaporation

Lethale dosis → 42 mg HCN / 70 kg body weight
